The time period for reply, if any, is set in the attached communication.

Office Action Summary

Application No.

10/718,692

Applicant(s)

LEE ET AL.

Examiner

SYED BOKHARI

Art Unit

2473

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 27 July 2009.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1, 3-7, 9-16 and 20 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1, 3-7, 9-16 and 20 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)

DETAILED ACTION

Response to Amendment

1. Applicant's amendment filed on September 29th, 2009 has been entered. Claims 2, 8 and 17-19 have been canceled. Claims 1, 3-7 and 9-16 have been amended. Claims 1, 3-7, 9-16 and 20 are pending in the application.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
 2. Ascertaining the differences between the prior art and the claims at issue.
 3. Resolving the level of ordinary skill in the pertinent art.
 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.
4. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation

under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

5. Claims 1, 3-5, 7, 9-11, 13-16 and 20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Aweva et al. (US 6,894,974 B1) in view of Hann (US 7,088,722 B1) and further in view of Border et al. (US 2002/0071436 A1) and Guttman et al. (USP 7,031,259).

Aweva et al. disclose a communication system for controlling packet transmission rate to reduce congestion with the following features: regarding claim 1, a communication system comprising a transmitter for transmitting one or more data packets at least one receiver connected to the transmitter for receiving the data packets and transmitting to the transmitter one or more response signals in response to the received data packets (Fig. 1, packet network, see "plurality of network elements" recited in column 4 lines 19-28); a multiplexer for multiplexing and transmitting to the transmitter the response signals transmitted from the receiver and transmitting the transmitted data packets from the transmitter to a corresponding receiver (Fig. 2, network elements, see "multiplexer 50" recited in column 5 lines 53-65); regarding claim 7, a communication system, comprising: at least one transmitter for transmitting one or more data packets; at least one receiver belonging to a private network and connected to the transmitter, for receiving the data packets and transmitting to the

transmitter one or more response signals in response to the received data packets (Fig. 1, packet network, see “plurality of network elements” recited in column 4 lines 19-28) and a gateway for arbitrating a communication protocol between the transmitter and the private network (Fig. 2, network elements, see “multiplexer 50” recited in column 5 lines 53-65); regarding claim 13, a communication method in which a receiver receiving data packets from a transmitter transmits to the transmitter response signals corresponding to the data packets, comprising (Fig. 1, packet network, see “plurality of network elements” recited in column 4 lines 19-28).

Aweva et al. does not disclose the following features: regarding claim 1, the multiplexer composed of a queue status monitor, a congestion control adjuster, wherein the queue status monitor monitors a queue status of at least one of the transmitted data packet and the response signals, wherein the congestion control adjuster instructs the receiver to compress the response signals based on the monitored queue status, wherein the receiver includes a response signal holding/compressing unit for, if instructed by the congestion control adjuster to compress the response signals, compressing the response signals for a second predetermined period of time; regarding claim 3, wherein the congestion control adjuster instructs the corresponding receiver to hold the response signals if the queue status of the monitored data packets is over a first threshold; regarding claim 7, the gateway composed of a queue status monitor, a congestion control adjuster, wherein the queue status monitor monitors a queue status of at least one of the transmitted data packet and the response signals, wherein the congestion control adjuster instructs the receiver to compress the response signals

based on the monitored queue status, wherein the receiver includes a response signal holding/compressing unit for, if instructed by the congestion control adjuster to compress the response signals, compressing the response signals for a second predetermined period of time; regarding claim 9, wherein the congestion control adjuster instructs a corresponding receiver to hold the response signals if the queue status of the monitored data packets is over a first threshold; regarding claim 14, wherein a congestion control adjuster instructs a corresponding receiver to hold the response signals if the monitored queue status of the data packets is over a first threshold; regarding claim 20, further comprising a first-in first-out (FIFO) buffer which outputs one of the one or more data packets transmitted from the transmitter and the one or more response signals transmitted from the receivers.

Hann discloses a communications system for controlling the flow of multiplexed data with the following features: regarding claim 1, the multiplexer composed of a queue status monitor (Fig. 3, a flowchart illustrating a method of controlling the flow of multiplexed data in the digital subscriber line access multiplexer, see "at step 204 FIFOs within DSLAM 30 are continuously monitored for status" recited in column 6 lines 50-54 and column 8 lines 25-27), a congestion control adjuster (Fig. 2, a block diagram illustrating a digital subscriber line access multiplexer 30 of the communication system, see "flow control unit 148 to receive flow control signal and gives directions" recited in column 6 lines 54-56), wherein the queue status monitor monitors a queue status of at least one of the transmitted data packet and the response signals (Fig. 3, a flowchart illustrating a method of controlling the flow of multiplexed data in the digital subscriber

line access multiplexer, see "at step 204 FIFOs within DSLAM 30 are continuously monitored for status of data storage capacity" recited in column 8 lines 20-27); regarding claim 3, wherein the congestion control adjuster instructs the corresponding receiver to hold the response signals if the queue status of the monitored data packets is over a first threshold (Fig. 2, a block diagram illustrating a digital subscriber line access multiplexer 30 of the communication system, see "the flow control unit 148 directs logic unit 112 to halt transmission of data" recited in column 6 lines 56-60); regarding claim 7, the gateway composed of a queue status monitor (Fig. 3, a flowchart illustrating a method of controlling the flow of multiplexed data in the digital subscriber line access multiplexer, see "at step 204 FIFOs within DSLAM 30 are continuously monitored for status" recited in column 6 lines 50-54 and column 8 lines 25-27), a congestion control adjuster (Fig. 2, a block diagram illustrating a digital subscriber line access multiplexer 30 of the communication system, see "flow control unit 148 to receive flow control signal and gives directions" recited in column 6 lines 54-56), wherein the queue status monitor monitors a queue status of at least one of the transmitted data packet and the response signals (Fig. 3, a flowchart illustrating a method of controlling the flow of multiplexed data in the digital subscriber line access multiplexer, see "at step 204 FIFOs within DSLAM 30 are continuously monitored for status of data storage capacity" recited in column 8 lines 20-27); regarding claim 9, wherein the congestion control adjuster instructs a corresponding receiver to hold the response signals if the queue status of the monitored data packets is over a first threshold (Fig. 2, a block diagram illustrating a digital subscriber line access multiplexer

30 of the communication system, see "the flow control unit 148 directs logic unit 112 to halt transmission of data" recited in column 6 lines 56-60); regarding claim 13, monitoring a queue status of at least one of the data packets and the response signals (Fig. 3, a flowchart illustrating a method of controlling the flow of multiplexed data in the digital subscriber line access multiplexer, see "at step 204 FIFOs within DSLAM 30 are continuously monitored for status of data storage capacity" recited in column 8 lines 20-27); regarding claim 14, wherein a congestion control adjuster instructs a corresponding receiver to hold the response signals if the monitored queue status of the data packets is over a first threshold (Fig. 2, a block diagram illustrating a digital subscriber line access multiplexer 30 of the communication system, see "the flow control unit 148 directs logic unit 112 to halt transmission of data" recited in column 6 lines 56-60); regarding claim 20, further comprising a first-in first-out (FIFO) buffer which outputs one the one or more data packets transmitted from the transmitter and the one or more response signals transmitted from the receivers of (Fig. 2, a block diagram illustrating a digital subscriber line access multiplexer 30 of the communication system, see "FIFO 134 receives the data, stores it and outputs it" recited in column 6 lines 14-30 and lines 50-67).

It would have been obvious to one of ordinary skill in the art at the time of invention to modify the system of Aweva et al. by using the features, as taught by Hann, in order to provide the multiplexer composed of a queue status monitor, a congestion control adjuster, wherein the queue status monitor monitors a queue status of at least one of the transmitted data packet and the response signals, the congestion control

adjuster instructs the corresponding receiver to hold the response signals if the queue status of the monitored data packets is over a first threshold, the receiver includes a response signal holding/compressing unit for, if instructed by the congestion control adjuster to hold the response signals and holding the response signals for a first predetermined period of time, the congestion control adjuster instructs a corresponding receiver to hold the response signals if the queue status of the monitored data packets is over a first threshold, a congestion control adjuster instructs a corresponding receiver to hold the response signals if the monitored queue status of the data packets is over a first threshold, the congestion control adjuster instructs the receiver to hold or compress the response signals based on the monitored queue status received from the queue status monitor and a first-in first-out (FIFO) buffer which outputs one the one or more data packets transmitted from the transmitter and the one or more response signals transmitted from the receivers of. The motivation is to enhance the functionality of the receiver for avoiding congestion in a cost effective manner.

Aweva et al. and Hann do not disclose the following features: regarding claim 1, wherein the congestion control adjuster instructs the receiver to compress the response signals based on the monitored queue status, wherein the receiver includes a response signal holding/compressing unit for, if instructed by the congestion control adjuster to compress the response signals, compressing the response signals for a second predetermined period of time; regarding claim 7, wherein the congestion control adjuster instructs the receiver to compress the response signals based on the monitored queue status, wherein the receiver includes a response signal holding/compressing unit for, if

instructed by the congestion control adjuster to compress the response signals, compressing the response signals for a second predetermined period of time;

Border et al. disclose a communication system directed to a method and system for improving performance of a network, and more particularly, to a method and system which performs spoofing to improve network performance with the following features: regarding claim 1, wherein the congestion control adjuster instructs the receiver to compress the response signals based on the monitored queue status (Fig. 2, a diagram of a PEP end point platform environment, according to an embodiment of the present invention, see "PEP 200, improves network performance by allocating TCP spoofing-related resources, such as buffer space, control blocks, etc., to TCP connections by spoofing to decrease data response time by reducing the number of ACKs which are transmitted by performing local acknowledgement and by acknowledging multiple TCP connections with a single ACK by performing data compression" recited in paragraph 0069 lines 1-9, paragraph 0070 lines 1-22 and paragraph 0094 lines 1-12); regarding claim 7, wherein the congestion control adjuster instructs the receiver to compress the response signals based on the monitored queue status (Fig. 2, a diagram of a PEP end point platform environment, according to an embodiment of the present invention, see "PEP 200, improves network performance by allocating TCP spoofing-related resources, such as buffer space, control blocks, etc., to TCP connections by spoofing to decrease data response time by reducing the number of ACKs which are transmitted by performing local acknowledgement and by acknowledging multiple TCP connections with a single ACK by performing data compression" recited in paragraph 0069 lines 1-9,

paragraph 0070 lines 1-22 and paragraph 0094 lines 1-12); regarding claim 13, instructing the receiver to compress the response signals based on the monitored queue status (Fig. 2, a diagram of a PEP end point platform environment, according to an embodiment of the present invention, see "PEP 200, improves network performance by allocating TCP spoofing-related resources, such as buffer space, control blocks, etc., to TCP connections by spoofing to decrease data response time by reducing the number of ACKs which are transmitted by performing local acknowledgement and by acknowledging multiple TCP connections with a single ACK by performing data compression" recited in paragraph 0069 lines 1-9, paragraph 0070 lines 1-22 and paragraph 0094 lines 1-12).

It would have been obvious to one of ordinary skill in the art at the time of invention to modify the system of Aweva et al. with Hann by using the features, as taught by Border et al., in order to provide the congestion control adjuster instructs the receiver to compress the response signals based on the monitored queue status, the congestion control adjuster instructs the receiver to compress the response signals based on the monitored queue status. The motivation is to enhance the functionality of the receiver for avoiding congestion in a cost effective manner.

Aweva et al., Hann and Border et al. do not disclose the following features: regarding claim 1, wherein the receiver includes a response signal holding/compressing unit for, if instructed by the congestion control adjuster to compress the response signals, compressing the response signals for a second predetermined period of time; regarding claim 4, wherein the congestion control adjuster instructs the corresponding

receiver to compress the response signals if the queue status of the monitored data packets is under a first threshold and over a second threshold; regarding claim 5, wherein the congestion control adjuster instructs the corresponding receiver to compress the response signals and if the queue status of the monitored data packets is under a first threshold and the queue status of the response signals is over a second threshold; regarding claim 7, wherein the receiver includes a response signal holding/compressing unit for, if instructed by the congestion control adjuster to compress the response signals, compressing the response signals for a second predetermined period of time; regarding claim 10, wherein the congestion control adjuster instructs a corresponding receiver to compress the response signals if the queue status of the monitored data packets is under a first threshold and over a second threshold; regarding claim 11, wherein the congestion control adjuster instructs a corresponding receiver to compress the response signals if the queue status of the monitored data packets is under a first threshold and the queue status of the response signals is over a second threshold; regarding claim 13, compressing by a congestion control adjuster, the response signals for a second predetermined period of time if the compression of the response signals is instructed; regarding claim 15, wherein a congestion control adjuster instructs a corresponding receiver to compress the response signals if the monitored queue status of the data packets is under a first threshold and over a second threshold and regarding claim 16, wherein a congestion control adjuster instructs a corresponding receiver to compress the response signals if

the monitored queue status of the data packets is under a first threshold and the monitored queue status of the response signals is over a second threshold.

Guttman et al. discloses a communication system for scheduling of compressible and non-compressible packets with the following features: regarding claim 1, wherein the receiver includes a response signal holding/compressing unit for, if instructed by the congestion control adjuster to compress the response signals, compressing the response signals for a second predetermined period of time (Fig. 1, scheduling table, see "determining to compress" recited in column 3 lines 49-56); regarding claim 4, wherein the congestion control adjuster instructs the corresponding receiver to compress the response signals (Fig. 1, scheduling table, see "determining a high bit rate threshold" recited in column 4 lines 37-44) and if the queue status of the monitored data packets is under a first threshold and over a second threshold (Fig. 1, scheduling table, see "determines whether to compress the packet" recited in column 4 lines 44-48); regarding claim 5, wherein the congestion control adjuster instructs the corresponding receiver to compress the response signals (Fig. 1, scheduling table, see "determining to compress" recited in column 3 lines 49-56) and if the queue status of the monitored data packets is under a first threshold and the queue status of the response signals is over a second threshold (Fig. 1, scheduling table, see "high and low thresholds" recited in column 3 lines 45-50); regarding claim 7, wherein the receiver includes a response signal holding/compressing unit for, if instructed by the congestion control adjuster to compress the response signals, compressing the response signals for a second predetermined period of time (Fig. 1, scheduling table, see "determining to

compress" recited in column 3 lines 49-56); regarding claim 10, wherein the congestion control adjuster instructs a corresponding receiver to compress the response signals (Fig. 1, scheduling table, see "determining a high bit rate threshold" recited in column 4 lines 37-44) and if the queue status of the monitored data packets is under a first threshold and over a second threshold (Fig. 1, scheduling table, see "determines whether to compress the packet" recited in column 4 lines 44-48); regarding claim 11, wherein the congestion control adjuster instructs a corresponding receiver to compress the response signals (Fig. 1, scheduling table, see "determining to compress" recited in column 3 lines 49-56) and if the queue status of the monitored data packets is under a first threshold and the queue status of the response signals is over a second threshold (Fig. 1, scheduling table, see "high and low thresholds" recited in column 3 lines 45-50); regarding claim 13, compressing by a congestion control adjuster, the response signals for a second predetermined period of time if the compression of the response signals is instructed (Fig. 1, scheduling table, see "determining to compress" recited in column 3 lines 49-56); regarding claim 15, wherein a congestion control adjuster instructs a corresponding receiver to compress the response signals (Fig. 1, scheduling table, see "determining a high bit rate threshold" recited in column 4 lines 37-44) and if the monitored queue status of the data packets is under a first threshold and over a second threshold (Fig. 1, scheduling table, see "determines whether to compress the packet" recited in column 4 lines 44-48) and regarding claim 16, wherein a congestion control adjuster instructs a corresponding receiver to compress the response signals (Fig. 1, scheduling table, see "determining to compress" recited in column 3 lines 49-56) and if

the monitored queue status of the data packets is under a first threshold and the monitored queue status of the response signals is over a second threshold(Fig. 1, scheduling table, see "high and low thresholds" recited in column 3 lines 45-50);

It would have been obvious to one of ordinary skill in the art at the time of invention to modify the system of Aweva et al. with Hann and Border et al. by using the features, as taught by Guttman et al., in order to provide the congestion control adjuster instructs the corresponding receiver to compress the response signals if the queue status of the monitored data packets is under a first threshold and over a second threshold, the congestion control adjuster instructs the corresponding receiver to compress the response signals and if the queue status of the monitored data packets is under a first threshold and the queue status of the response signals is over a second threshold, if instructed by the congestion control adjuster to compress the response signals, the congestion control adjuster instructs a corresponding receiver to compress the response signals if the queue status of the monitored data packets is under a first threshold and over a second threshold, the congestion control adjuster instructs a corresponding receiver to compress the response signals if the queue status of the monitored data packets is under a first threshold and the queue status of the response signals is over a second threshold, compressing by a congestion control adjuster, the response signals for a second predetermined period of time if the compression of the response signals is instructed, a congestion control adjuster instructs a corresponding receiver to compress the response signals if the monitored queue status of the data packets is under a first threshold and over a second threshold and a congestion control

adjuster instructs a corresponding receiver to compress the response signals if the monitored queue status of the data packets is under a first threshold and the monitored queue status of the response signals is over a second threshold. The motivation is to enhance the functionality of the receiver for avoiding congestion in a cost effective manner.

6. Claims 6 and 12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Aweva et al. (US 6,894,974 B1) in view of Hann (US 7,088,722 B1), Border et al. (US 2002/0071436 A1) and Guttman et al. (USP 7,031,259) as applied to claims 1, 7 and 13 above, and further in view of Norrell et al. (USP 6,853,637 B1).

Aweva et al., Hann, Border et al. and Guttman et al. describe the claimed limitations as discussed in paragraph 5 above. Aweva et al., Hann, Border et al. and Guttman et al. do not disclose the following features: regarding claim 6, wherein the transmitter transmits the data packets at a first transmission rate exceeding 6 Mbps, and the receiver transmits the response signals at a second transmission rate under 900 Kbps and regarding claim 12, wherein the transmitter transmits the data packets at a first transmission rate exceeding 6 Mbps, and the receiver transmits the response signals at a second transmission rate under 900 Kbps.

Norrell et al. disclose a local shared communication medium with the following features: regarding claim 6, wherein the transmitter transmits the data packets at a first transmission rate exceeding 6 Mbps, and the receiver transmits the response signals at

a second transmission rate under 900 Kbps (Fig. 1, communication system, see "ADSL supports up to 6 Mbps" recited in column 2 lines 15-32 in background of the invention) and regarding claim 12, wherein the transmitter transmits the data packets at a first transmission rate exceeding 6 Mbps, and the receiver transmits the response signals at a second transmission rate under 900 Kbps (Fig. 1, communication system, see "ADSL supports up to 6 Mbps" recited in column 2 lines 15-32 in background of the invention).

It would have been obvious to one of ordinary skill in the art at the time of invention to modify the system of Aweva et al. with Hann, Border et al. and Guttman et al. by using the features, as taught Norrell et al., in order to provide the transmitter transmits the data packets at a first transmission rate exceeding 6 Mbps, and the receiver transmits the response signals at a second transmission rate under 900 Kbps, the transmitter transmits the data packets at a first transmission rate exceeding 6 Mbps, and the receiver transmits the response signals at a second transmission rate under 900 Kbps. The motivation of using these functions is to enhance the system in a cost effective manner.

Response to Arguments

7. Applicant's arguments with respect to claims 1-16 and 18-20 have been considered but are moot in view of the new ground(s) of rejection. Applicant states in the remarks regarding claim 1, "In Aweva, the ACK pacing control unit (38) disposed outside the MUX (50) comprises the Q monitor (see FIG. 2). The flow control unit (148) of Hann would be disposed outside the MUX (50) when the MUX (50) of Aweva is

combined with the flow control unit (148) of Hann. Therefore, Applicant submits that even those skilled in the art cannot derive that the Q monitor is included inside the MUX (50) of Aweva. Furthermore, it is logical that flow control is performed according to the monitored Q status. Accordingly, it is obvious that the Q monitor is disposed outside the MUX (50), so there is no teaching or suggestion that the flow control unit is disposed inside the MUX (50) if Aweva and Hann were to be combined". Examiner respectfully disagrees. The q monitor is not claimed as inside the Mux. The specification states "the multiplexer is provided with a queue status monitor for monitoring queue statuses of the transmitted data packets and/or response signals" recited in paragraph 0023 lines 8-10. Further, specification describes " the gateway is provided with a queue status monitor for monitoring queue statuses of the transmitted data packets and/or response signals" recited in paragraph 0027 lines 7-9.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to SYED BOKHARI whose telephone number is (571)270-3115. The examiner can normally be reached on Monday through Friday 8:00-17:00 Hrs..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kwang B. Yao can be reached on (571) 272-3182. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>.
